

JEP system

Title: JEP system (Electronic procedures building block)

A brief description:

The JEP system is the central part of the information solution for the full and contemporary electronic implementation of public procedures. JEP performs the function of a procedure and form editor and wizard to fill out electronic forms in procedures, including centralized e-signature and e-payment. JEP sends a completed user request to the competent public authority or allows it to handle the application form within the system itself, if the body does not have its own document management system.

The modern referential architecture is typical for the construction of the JEP system. It integrates various building blocks, including the standardized envelope for exchange of EDV e–documents. Other JEP functionalities include also eDelivery (using SI-CeV service), authentication (SI-CAS), e-signature (SI-CeS), time stamping (SI-TSA), and UJP e-payments system. To collect data from different base registers or public evidences JEP uses Pladenj building block. It also contains a catalogue of e-services and introduces a central module for assigning unique case numbering. The JEP system provides the competent authorities with a simple, modern and an innovative way of designing and managing forms and e-procedures.
